Catching variation during fieldwork on Nakh-Daghestanian languages

George Moroz, Samira Verhees

Linguistic Convergence Laboratory, NRU HSE

24 April 2020 (Dialectology and Linguistic Geography, Institute of Linguistics, RSUH)

Presentation is available here: tinyurl.com/y78s9jbb

Investigating variation:

 In variationism (e.g. (Labov 1963) on Martha's Vineyard /ai/ ~ /au/, (Trudgill 1974) on Norwich speech, (Wolfram 1969) on Afro-American speech from Detroit) researchers get mad about social stratification, mostly urban.

Investigating variation:

- In variationism (e.g. (Labov 1963) on Martha's Vineyard /ai/ ~ /au/, (Trudgill 1974) on Norwich speech, (Wolfram 1969) on Afro-American speech from Detroit) researchers get mad about social stratification, mostly urban.
- "Two equally interesting questions are at the heart of this book: how an extraordinary degree of idiosyncratic linguistic variation can coexist with an extraordinarily homogeneous speaker population, and how linguists might overlook the possibility of their coexistence." (Dorian 2010: 3)

Investigating variation:

- In variationism (e.g. (Labov 1963) on Martha's Vineyard /ai/ ~ /au/, (Trudgill 1974) on Norwich speech, (Wolfram 1969) on Afro-American speech from Detroit) researchers get mad about social stratification, mostly urban.
- "Two equally interesting questions are at the heart of this book: how an extraordinary degree of idiosyncratic linguistic variation can coexist with an extraordinarily homogeneous speaker population, and how linguists might overlook the possibility of their coexistence." (Dorian 2010: 3)
- In this talk we explore variation in a small, homogeneous speaker population and the probability that an average researcher of Nakh-Daghestanian languages catches this variation.

Data

Data

Data were collected from

 44 speakers of Andi (Nakh-Daghestanian) during fieldwork in Zilo (Botlikh district, Dagestan) in 2019

Created with lingtypology (Moroz 2017)

Data

Data were collected from

 44 speakers of Andi (Nakh-Daghestanian) during fieldwork in Zilo (Botlikh district, Dagestan) in 2019

Created with lingtypology (Moroz 2017)

 and 23 researchers of Nakh-Daghestanian languages via an online questionary

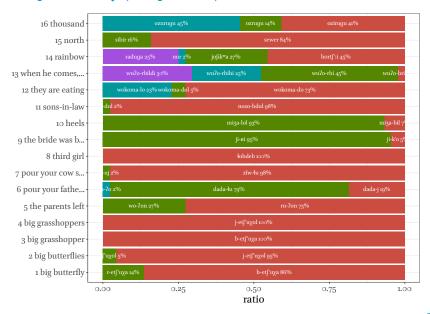

Zilo Data

44 Zilo speakers were asked to translate 16 stimuli:

- 1 'big butterfly'
- 2 'big butterflies'
- 3 'big grasshopper'
- 4 'big grasshoppers'
- 5 'the parents left'
- 6 'pour your father some water'
- 7 'pour your cow some water'
- 8 'third girl'
- 9 'the bride was beautiful at the wedding'
- 10 'heels'
- 11 'sons-in-law'
- 12 'they are eating'
- 13 'when he comes, we will eat'
- 14 'rainbow'
- 15 'north'
- 16 'thousand'

Zilo questionary (44 speakers): results

Information entropy

In order to measure diversity of the questions we used the easiest measure — the information entropy, introduced in (Shannon 1948):

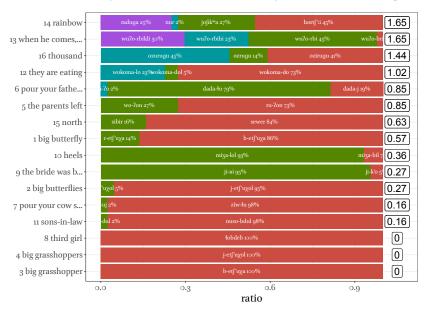

$$H(X) = -\sum_{i=1}^n P(x_i) \times \log_2 P(x_i)$$

Range of the information entropy is $H(X) \in [0, +\infty]$:

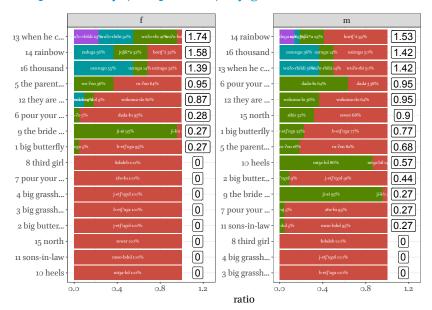

| data | entropy |
|-----------|---------|
| A-A-A-A | 0.00 |
| A-A-A-B | 0.72 |
| A-A-A-B-B | 0.97 |
| A-A-B-B-B | 0.97 |
| A-A-B-B-C | 1.52 |
| A-B-C-A-B | 1.52 |

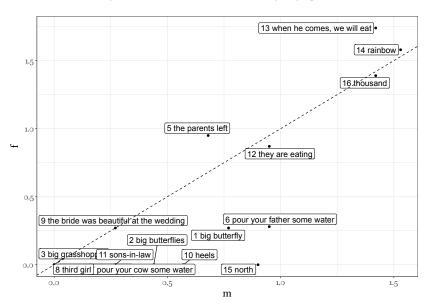

Zilo questionary (44 speakers): entropy value on the right

Zilo questionary (44 speakers): by gender

Zilo questionary (44 speakers): entropy by gender

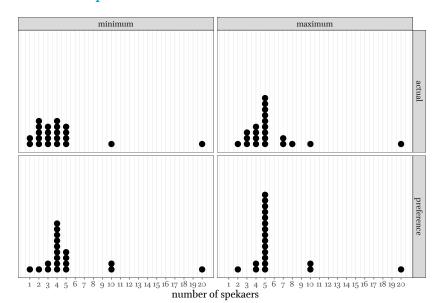

Nakh-Daghestanian Fieldwork Survey

23 ND researchers were asked about:

- level of education
- linguistic interest
- studying linguistics at university
- fieldwork participation as a student
- year in which they finished their degree
- place of study and work
- number of people who participated in their fieldtrips
- preferred number of participants in fieldtrips
- goals of fieldwork
- use of elicitation and corpora
- number of speakers a researcher *should* consult with
- number of speakers the researcher usually consults with
- how researchers need to deal with interspeaker variability
- how researchers need to deal with intraspeaker variability
- whether speakers under the age of 13 are reliable consultants
- whether speakers older than 70 are reliable consultants
- personal (dis)preferences about the choice of consultants

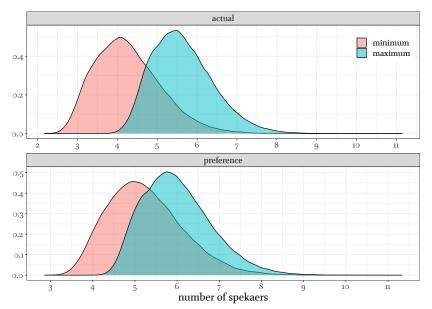

Number of speakers

Bootstrapped mean number of speakers (10⁵ iterations)

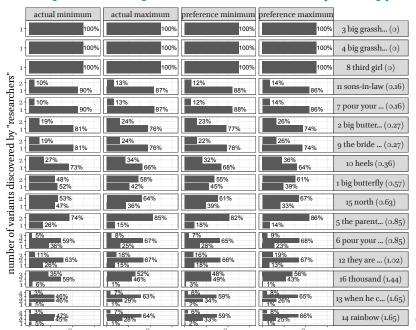

What if 10^5 "average researchers" ...

come to Zilo?

10^5 samples from experiment results

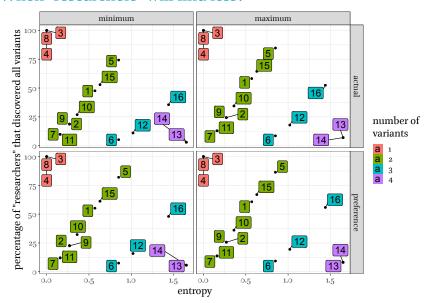

| | actual minimum | actual maximum | preference minimum | preference maximum | |
|----------------|---------------------------|------------------|--------------------|--------------------|--------------------|
| | 2 48% 1 52% | 58% 42% | 55% 45% | 61% 39% | 1 big butterfly |
| p _s | | 24% 76% | 23% | 26% 74% | 2 big butterflies |
| | 100% | 100% | 100% | 100% | 3 big grasshopper |
| | 100% | 100% | 100% | 100% | 4 big grasshoppers |
| | 2 74% | 15% | 18% | 14% | 5 the parents left |
| | 3 2 1 36% 59% | 8% 25% 67% | 7% [28%] 65% | 9% 23% 68% | 6 pour your fathe |
| | | 13% | 12% | 14% | 7 pour your cow s |
| | 100% | 100% | 100% | 100% | 8 third girl |
| | 2 19% 81% | 24% | 22% | 26% 74% | 9 the bride was b |
| | 2 27% 73% | 34% | 32% | 36% 64% | 10 heels |
| | | 13% | 12% | 14% | 11 sons-in-law |
| | 3 1 11% 26% 63% | 15% | 18% 66% | 19% 67% | 12 they are eating |
| umb | 4 3 1 5% 46% | 7% 63% 1% 29% | 6% 34% 59% | 8% 65% | 13 when he comes, |
| = | 3 1 3% 47% | 7% 64% | 6% 33% 59% | 8% 66% | 14 rainbow |
| | 2 53% 1 47% | 36% | 61% 39% | 33% | 15 north |

10^5 samples from experiment results sorted by entropy

When "researchers" will find less?

Number on the plot represents number id of the question.

Conclusions:

- Shannon information entropy helps to find some variation spots
- An "average researcher" might overlook a significant amount of the variation we observed due to the low number of speakers they usually consult with (more possible values and lower variable entropy is higher likelyhood of overlooking)
- However, our experiment with 44 speakers also failed to show some of the variation we found in prior research on this dialect
- The observed variation should be explored in more detail using the collected sociolinguistic parameters (it looks like variation does not corelate with gender)
- The characteristics of the "average researcher" of Nakh-Daghestanian languages can be further eloborated using the parameters collected in the survey
- The observed variation remains a collection of isolated lexical, phonological and morphological facts...
